👩‍💻 Executive Decisions

Top Recommendations and why they were chosen.

👥 Customers

Who buys, who is slipping, who to win back.

📦 Products

Which categories and SKU's to push or fix.

🚚 Operations

Fulfillment, carriers, and return issues.

💵 Finance

Margin, leakage and cost pressure.

🚀 Marketing

Is ad spend paying for itself, by channel.

❓ About & Methodology

How each KPI, score, number and recommendation is built.

⚙️ Configuration

Thresholds and rules behind the advice.

Good to know

Use 21+ days for stable recommendation | Right-click a row, then Drill-through for detail | Periods end on latest order date not today

Actions and recommendations are starting points, the data decides what to look at, the team decides what to do.

Top row: KPIs for the selected period, with change vs the previous period (% for values, pp for rates).
Chart: the trend behind the numbers. Use the buttons to switch metric.
Recommendation: the main story, why it was chosen, and what to do next.
Pills: Live, Matured or Snapshot, which tells you how settled a number is.

Version 1.0 | Data through: 8 Oct 2026 | Last refreshed 16 Oct 2026, 02:45 | Recommendations are rule-based starting points. Review before acting.

E-Commerce Decision Dashboard

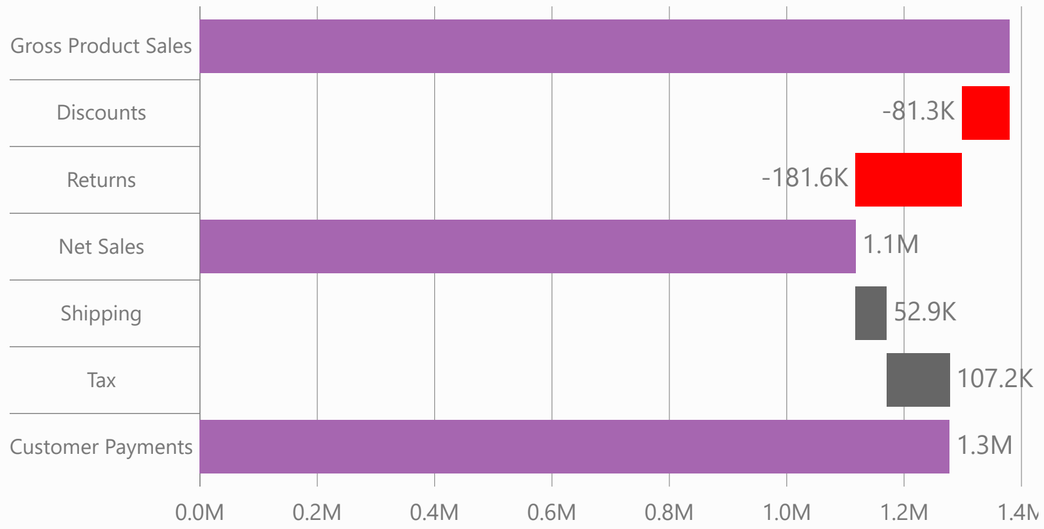

Identify the main business issue in the current period and where to focus first.

Channel Quality Diagnostic

Action & Insight

25% of customers acquired over 90 days ago have never ordered again, and only 29% of customers place a second order within 90 days. Bottoms is the leakiest entry category: 24% of its first-time buyers never reorder.

Make the second order a standing programme: a post-purchase journey with a reorder offer at day 56 after the first order, ahead of the typical second order at day 94, plus a review of the entry products that lose first-time buyers. Start with Bottoms buyers and customers acquired through Influencer. Track the 90-day second-order rate, now 29% across 10,952 customers.

1,932 one-time customers make up 24% of customers who ordered in this period. Influencer has the highest one-time rate at 27%.

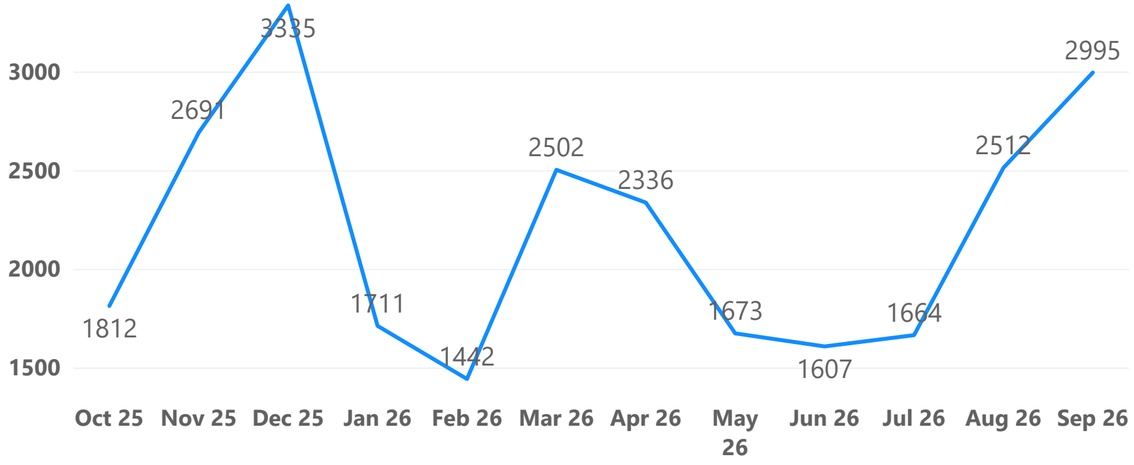

Product Intelligence

Core Hoodie	0	29	New product outperforming and High attachment rate	Promote & scale — New product outperforming + High attachment rate
Drop Sock	0	25	Growth and Strong product affinity	Review carefully — Growth +26% but also Strong product affinity

Discount Insight

50% of units sold were discounted. Discounted units earn 51.1% margin vs 57.4% at full price (6.2 points lower), with $81,289 given away. Discounting is limited but expensive. Tighten the depth or target it at customers who would not otherwise buy.

Portfolio Recommendation

Sales +23.9% and profit +23.1% at a 54.5% margin. Bottoms is leading, up $59,830. Put extra stock and ad spend behind the winners, and avoid discounting the wider range to chase volume.

Evri	2,444		78.4%	28.8%	$4.19

Overall Recommendation

Returns quality is the main operational priority this period. Return signals indicate that preventable operational causes may be contributing to post-purchase loss rather than customer preference alone. The clearest opportunity is to reduce avoidable returns by tightening handling, packing, and order-accuracy controls before focusing on broader service optimisation. Network-wide: only 79.1% of orders were delivered within 5 days of being ordered, against a target of 90%. Every carrier is close to this level, so the cause is more likely dispatch, packing or the target itself than any one

Priority Actions

Returns Issue

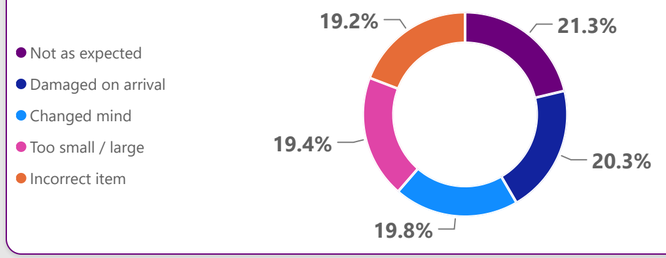

Investigate damaged, incorrect, and other preventable return drivers first.

Audit pick-pack quality control and order accuracy.

Reduce write-off exposure from avoidable returns and improve handling controls.

Returns Diagnostic

Reason | Condition | Disposition

If preventable returns continue to rise, both margin and customer satisfaction may weaken.

Broad Stabilisation

Insight	Financial performance is broadly stable, with no single acute leakage source dominating.
Diagnosis	The current pattern suggests financial control is broadly holding, with optimisation more important than intervention.
Recommendation	Financial performance is broadly stable in the current period. Revenue, profit conversion, and key leakage drivers are not showing a single dominant point of deterioration, suggesting the business can focus on preserving margin discipline while selectively optimising weaker segments and cost lines.
Risk	The main risk is gradual deterioration in leakage or mix rather than an acute financial breakdown.

Refund Rate %
by City

Dimension: City

KPI: Refund Rate %

Profit Leakage Drivers

Financial Drag	Value	% Gross Sales	vs. prior
Discounts	$81.3K	5.9%	0.7pp
Refunds	$181.6K	13.2%	0.2pp
Shipping	$52.9K	3.8%	0.1pp

Recommendation is ready because the selected date range is suitable for stable financial interpretation.

Priority Actions

Action 1	Maintain current margin discipline and focus on selective optimisation rather than broad changes.
Action 2	Target the weakest cost or segment line for incremental improvement.
Action 3	Continue monitoring refund, discount, and cost signals for early deterioration.

Marketing Intelligence

Is advertising paying for itself, and where should the budget move?

Campaign efficiency: Spend vs. ROAS

Marketing Diagnosis

Efficiency Decline

Advertising efficiency has fallen sharply compared with the previous period.

ROAS is 2.7x, down 31% on the previous period. Spend rose 142% over the same time, so the return per $1 is weakening, not just the volume.

Recommendation

Find out what changed before adding budget. Compare this period with the previous one on audience, creative, offer and discount depth, and hold spend at plan until ROAS stabilises.

Priority Actions

Trim spend on Paid Social until its ROAS recovers.

Compare audience, creative and discount against the previous period to find what changed.

Hold budgets at plan until ROAS stops falling.

Risk Statement

If efficiency keeps falling, rising spend will buy fewer orders and compress margin.

? About and Methodology

Understand how recommendations are generated, how metrics are interpreted, and what assumptions are applied.

KPI Dictionary

KPI	Basis	Timing	Unit
Net Sales	Order line net amount after discounts, minus allocated returns. Excludes tax and shipping	Live	Currency
Gross Product Sales	Sum of line gross amounts before discounts and returns	Live	Currency
Total Orders	Distinct orders placed in the period	Live	Count
Average Order Value	Net Sales / Total Orders	Live	Currency
Gross Profit	Net Sales minus cost of goods sold	Live	Currency

Score And Confidence Definition	Confidence Band Legend	Confidence Drivers Explained
Score (0-100) = how strong the signal behind a recommendation is. Under 10: hold steady. 10-14: mild. 15-34: moderate. 35+: significant. Confidence (0-100) is how far this recommendation can be trusted, not how big the problem is. It blends four checks: enough days in the range, enough orders, enough of the data present, and a clear gap between this	High (70-100): act on it. Range, volume and data are sufficient and the story clearly leads. Medium (40-69): a likely direction, but check the detail first. Either the range or order count is thin, or a close second story exists. Low (0-39): indicative only. Too little time or data, or the signal is too weak to separate from noise.	Window (35%): 30 days = full marks. Volume (30%): 200 orders = full marks. Completeness (20%): share of the story's signals that have data. Clarity (15%): a 10-point lead over the next story = full marks. Caps: under 21 days max 39; a near-tie max 69; a story scoring under 15 max 39, under 35 max 69.

Customer segments (hover for definition)

At Risk	Early Lifecycle	Inactive	Loyal	Occasional	One Time	Potential Loyalist	Registered No Order
1,220	1,139	2,205	240	65	2,241	971	2,049

Live, Matured, Snaphot

Live — Counts everything up to the latest order date.

Matured — only orders old enough have outcomes (7 / 10 / 21 Days).

Snapshot — A picture of current exposure or lifetime totals, not tied to the selected period.

How a recommendation is built

Signals → **Scores** → **Story** → **Text**

If two stories score the same, the one higher in this priority list is shown first:
1 Protect Profitability, 2 Recover Demand, 3 Recover Retention, 4 Win Back, 5 Category Recovery, 6 Stabilise Service, 7 Scale Growth, 8 AOV Uplift.
The order reflects business priority: protect margin and cash first, rebuild demand and customer base next, fix service and category issues after that, and only then pursue growth and basket-size gains.
Priorities are set in Config Stories and can be changed there.

Not included

- Operating costs and overheads
- Tax (Net sales excludes it)
- Spend outside the marketing data
- ROAS includes tax and shipping in revenue

This dashboard turns your data into decision support. Its output depends on the data it is given.
- Some fields are derived from observed behaviour, such as segments and lapse thresholds.
- Recent operations and returns figures are excluded until outcomes mature (7 / 10 / 21 days).
- Recommendations are the most likely reading of visible signals, not a confirmed root cause.
- It supports business judgement, testing and operational checks. It does not replace them.

Thresholds you can tune

Area	Setting	Value	Purpose
Portfolio & Category	Return gap	3pp	Return rate above the store rate by this much counts as high
Portfolio & Category	Margin weak offset	3pp	Margin below store margin by this much counts as weak
Portfolio & Category	Margin strong offset	0pp	Margin above store margin by this much counts as strong
Attention	Margin drop threshold	-3pp	Margin fall that triggers margin protection
Attention	High discount share	15%	Discount share that triggers margin protection
Attention	Velocity leader share	15%	Top share of products by units
Attention	High growth threshold	25%	Sales growth that scores as high growth
Attention	Medium priority cutoff	0.40	Attention score for Medium

Sales Importance Explained

Sales importance scales a product's sales against the best seller, using the square root of the ratio so that mid-sized products still count. A product with 25% of the top seller's sales gets 50% weight (not 25%); one with 4% gets 20%; one with 1% gets 10%. Without the square root, a long tail of smaller products would be pushed to near-zero and one best seller would dominate the attention ranking. It only scales the signals: a product with no problem and no opportunity still scores 0.

To win back the dormant customers worth recovering: inactivity duration shows how many customers are still within reach of ...

Recommended views: Inactivity Duration + Historic Value

Action & Insight

To win back the dormant customers worth recovering: inactivity duration shows how many customers are still within reach of a win-back, and historic value shows where this segment's revenue is concentrated.

Focus effort on preventing lapse earlier and treat deeply lapsed Inactive customers as low priority, prioritising the 2,121 customers who have previously spent over $100, leading with Bottoms, the category most of them bought.

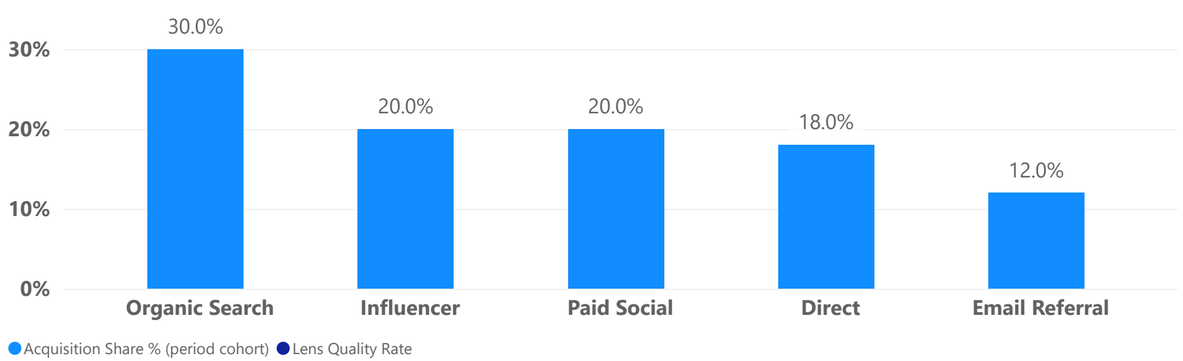

The largest group of Inactive customers (58%) has been inactive for 1-2 Years. Their typical reorder cycle is about 102 days, and the median customer is 336 days past that point (4.5x their usual cycle). 2,121 customers (96%) have spent over $100 historically, together $823,568 of lifetime spend. Bottoms is the category most of them bought (88%).

2,205 Inactive customers (no order for 300+ days) have spent $829,773 with you in total, about $376 each. 97 are within 90 days of their expected reorder point, the most recoverable group. Illustrative: if 15% of these 97 customers ordered again within 90 days (observed for customers in the 180+ Days window), one order each at their average order value of $90 would be about $1,327. 2,205 Inactive customers are currently within the 180+ Days intervention window, where the observed 90-day probability of becoming active again is 15% (95% range 15% to 16%, from 16,773 past cases). This is the only recency window with observed history for Inactive, so every customer in the segment sits in it and acting on the whole group is the priority.

Carrier Diagnosis — Evri

Insight	Evri is broadly performing in line with the network, with no single acute operational issue dominating.
Diagnosis	Current performance is broadly in line with network benchmarks, suggesting no immediate carrier-specific intervention is required.
Risk	The main risk is slow deterioration rather than acute failure, so continued benchmark monitoring remains important.

Priority Actions

Headline	Stable / Strong
Action 1	Maintain current monitoring and focus intervention on weaker carriers first.
Action 2	Use this carrier as a benchmark reference for weaker-performing partners where relevant.
Action 3	No immediate corrective action is required beyond continued performance monitoring.
